

The Vibe Coding Mindset

Module 1

Class Expectations

Cameras On

Be present and visible with your camera on to stay engaged in class.

Arrive On Time

Respect everyone's time by arriving promptly to sessions.

Active Engagement

During exercises and labs, participate actively in all discussions and activities.

Network

During class, connect with peers and build your learning network.

Use Slack

Use Slack for all communication to keep questions and comments organized.

Instructor Support

Save deeper questions for after class with your instructor so as to not stop class flow.

Introductions

Meet Your Instructor 🖐️

Get to know your course instructor as they answer and share:

- **Background:** What's their personal story and background?
- **Career:** How did they get into their field?
- **Milestones:** What are some significant milestones achieved in their career?

Introduce Yourself 🧑💻

Get to know your peers and build your network as you answer:

- **Background:** What's your name, where are you located, and what's your current role?
- **Course Goals:** What do you hope to learn in this course?
- **Fun Fact:** What's a hobby or interest you have outside of work?

Share your intro info and LinkedIn profile in the Slack channel to connect with your peers!

Vibe Coding Syllabus

MODULE 1

The Vibe Coding Mindset

Experience the full Build-Show-Learn-Decide cycle in a single session. Build multiple prototypes from one ambiguous problem, get real feedback, and make decisions based on evidence. Learn the Confidence Line framework retroactively—prove you can build fast before naming why.

MODULE 2

The Validation Lense

Name the assumption before you open the tool. Master problem framing, assumption mapping, and fidelity mapping to build smart—not just fast. Learn to test the right thing with divergent prototypes and structured peer validation.

MODULE 3

The Precision Shift

Shift from "build me something" to "build me exactly this." Master context layering, constraint injection, and living prompt packs to direct AI like a tech lead. Match your prompting style to your confidence level.

MODULE 4

The Graduation Moment

Recognize when to stop exploring and start building for real. Extract a living spec from what you've built, refactor exploratory code into maintainable structure, and bridge from PM prototype to engineering-ready deliverable.

MODULE 5

The Integration Leap

Connect your prototype to real databases, APIs, and services. Handle authentication, edge cases, and failure modes. Learn to present your work to engineering with a living spec that accelerates their work—not replaces it.

MODULE 6

From Localhost to Live

Take your product from localhost to a live URL. Deploy, present with a compelling narrative, and leave with a personal vibe coding practice. Everyone ships. Everyone goes home with a deployed product and evidence that drives decisions.

Ground Rules

All action. Nothing to remember.

Not a Lecture

You'll build more in 2 hours than most PM courses cover in a week. Hands-on from minute one. We're here to create, not consume slides.

Pre-work Done

Lovable is set up. We're skipping setup entirely. You're ready to build right now. No technical barriers between you and your first prototype.

Your Project

You will build and present your own application by the end of this course. It's individual—no group dependencies. Tons of group activities during class, but the final project is yours alone.

No Homework Between Sessions

Plenty to explore, but not required. You don't have to worry about doing a lot of homework in between. Show up, build, learn, repeat.

Move Fast

Tool issues? Message Slack. Keep building, keep learning. Don't let technical hiccups slow your momentum. The goal is continuous forward motion.

Let's go.

Final Project Explanation

Final Project

Deliverable

GOAL

Demonstrate your

DELIVERABLE

Google Slide Deck or PDF of deck

TIMING

[OPTIONAL] For those who wish to demo their prototype in Module 6, 7-10 minutes per student will be allotted.

Note this is not mandatory for certification, but every student must submit their deliverables deck/PDF.

You can find the full brief here and access the final presentation template here

Final Project Requirements

What You'll Build

- A fully functional prototype addressing a real product challenge
- Individual work—your vision, your execution
- Demonstrated through live presentation and working link

Success Criteria

- Tests a clear hypothesis or solves a specific problem
- Shows evidence of iteration and user feedback
- Feels production-ready, not like a toy

Agenda

01 The AI-First Product Mindset →

02 The Anatomy of High-Quality Prompt →

03 Hands-On Lab: Prompt-to-Prototype Your Copilot with Lovable →

04 Prompting as Product Configuration →

05 The Optimization Strategy →

Instructor-Led Demo

The Triple-Threat Build

! THE PROBLEM:

Enterprise customers are churning 30 days after onboarding. The VP of Customer Success thinks it's a UX issue. The Head of Product thinks you need better feature discovery. The CEO thinks we should add a self-serve analytics dashboard.

Nobody has data. Everybody has opinions.

Your Vibe Coding Tool Stack

💡 IMPORTANT

Why Lovable?

We're using the best tool in the market right now: Lovable. **Partnership with Product School means you get Pro access for free throughout this course.**

Lovable's visual-first interface offers the lowest barrier for non-technical PMs, meaning you don't need to understand code to build functional prototypes. **This will be our main tool throughout the course.**

On your own, you're welcome to explore additional tools outside of class as you progress that are part of our AI Tools Package.

Your Pro package includes ~100 credits per month—**not** unlimited.

TIP: Do your prompt planning in Gemini or ChatGPT. Paste the prompt into Lovable when it's time to build to save on credits.

Hands-On Lab

Your First Vibe Build in Lovable

Individual Exercise

Your First Vibe Build in Lovable

In this hands-on lab, you'll dive straight into the vibe coding cycle by building a functional, shareable prototype from scratch.

- Your goal is to prove that you can move from a vague problem to a clickable solution in under 20 minutes. There are no technical barriers, just your instincts and the prompt box
- Keep in mind: This is a **solo build to test your speed and intuition**. Success is measured by a shareable link, not a polished product

LAB EXERCISE

20 minutes

Steps to follow:

1. Open [Lovable](#) and choose one of the three scenarios from the lab guide (Fitness, B2B SaaS, or Your Own Product) to anchor your build.
2. Write your prompts:
 - **Option 1 - Copy & Customize:** Use the starter prompt in the lab guide and replace the [brackets] with your specific feature or user type.
 - **Option 2 - First Screen Method:** Visualize the very first thing your user sees and prompt Lovable to build exactly that.
3. Build on instinct, rather than methodology or framework; focus on speed and immediate execution to get a functional UI running.
 - If the output isn't right, prompt again or prompt differently. Aim for "clickable" over "perfect."

Find detailed instructions to complete this lab [here](#)

Breakout Group Exercise

Show and Swap Your Prototype

To reflect upon what you've built, pair up with a peer and experience their prototype as a real user. This mirrors actual user behavior and allows you to gather raw feedback on whether your "vibe" translates into a functional tool.

- Swap prototype links in the chat.
- Explore your partner's build silently for 3 minutes without providing or receiving any verbal context.

Q&A REVIEW

10 minutes

After 3 minutes of silent exploration, discuss the following:

- 1. What you understood immediately about the product's purpose.**
- 2. What confused you about the prototype.**
- 3. What assumption you thought this prototype was testing.**

Quick Debrief

Key Learning Statement

POST ON SLACK

IN ONE SENTENCE:

What was **something surprising** you learned from watching someone use your prototype.

Break

Estimated time: 5 minutes

Reminder! 🚨

→ Cameras On

It's always better to see your smiling face!
Be present and visible to stay engaged and
keep interactions valuable.

Lorem Ipsum Title

Instructor-Led Demo

Moving from Basic to Pro and the Art of Iteration

! THE PROBLEM:

You have three working prototypes, but they all look like "vibe" sketches. Your VP of Design won't look at them because they don't match the brand, and your Engineering Lead says they are too generic to be useful.

Speed got you the idea. Now, strategic iteration must get you the buy-in

Hands-On Lab

Strategically Refine Your Build in Lovable

Individual Exercise

Strategically Refine Your Build in Lovable

In this hands-on lab, you'll take your initial prototype and apply strategic upgrades to move it from a "vibe" sketch to a professional tool.

- Your goal is to prove you can steer the AI toward excellence by refining the visual design and adding genuine functional interactivity.
- Keep in mind: This is a **solo build**. Your final prototype should feel like something you would proudly show to your VP.

LAB EXERCISE

15 minutes

Steps to follow:

1. Return to your Lab 1 prototype in [Lovable](#) and identify the weakest section or the most critical gap in the "vibe."
2. Select at least two upgrades to transform your rough sketch into a production-ready tool:
 - **Design Match:** Use a [Mobbin](#) screenshot to clone professional colors, layouts, and navigation.
 - **Add Interactivity:** Configure a functional filter, a working detail view, or a form that validates.
 - **Refine without Rebuilding:** Use a focused prompt to surgically fix one specific section.
 - **Existing Product Track:** Match your actual company's design system and layer your new feature on top.
3. Generate your upgraded link and prepare to share the "Before and After" transformation.

Return to your walkthrough **here** to complete the activity.

Breakout Group Exercise

Swap and Review Your Refined Prototype

To reflect on your progress, pair up with a new peer to see if your refinements stand up to fresh eyes. This is a blind stress test to see if your iteration successfully moved the build from a rough idea to a professional tool.

- Swap prototype links in the chat.
- Explore your partner's build silently for 3 minutes without providing or receiving any verbal context.

Q&A REVIEW

10 minutes

After 3 minutes of silent exploration, discuss the following:

- 1. Does this feel like a "real" product or just a visual mockup?**
- 2. Where did the interactivity fail to meet your expectations as a user?**
- 3. Would you show this to your VP as a credible representation of a solution?**

Quick Debrief

Production- Readiness Score Statement

POST ON SLACK

IN ONE SENTENCE:

Score your refined prototype from
1-5 and why:

1 = Just a Sketch

It exists, but it's not ready for eyes

5 = VP Ready

*I'd present this to leadership
tomorrow*

Lorem Ipsum Title

PM Independence is ROI

The New Operating Model

Old Way: Dependency Loop

New Way: Builder Loop

The Era of Vibe Coding

PMs harness the power of vibe coding to execute the specific discipline of AI prototyping.

Vibe Coding

The Methodology:

Embracing AI to translate plain language intent into code. It prioritizes rapid iteration and creativity "vibes" over micromanaged technical details or syntax.

AI Prototyping

The Application:

Leveraging AI code generation to build functional prototypes instantly. Tools interpret prompts and designs to validate ideas without requiring coding expertise.

The Confidence Line

The goal of Vibe Coding is to move your product idea across the Confidence Line and use prototypes to systematically kill ambiguity and replace it with evidence.

From Toy to Tool

Product exploration often prioritized aesthetic polish over functional logic, creating artifacts that impressed stakeholders but didn't reduce project risk.

- Generates applause, not insights.
- Lacks logic for edge cases.
- Prioritizes "vibe" over clarity

The Old Way: The Toy 🎡

The New Way: The Tool 🛠️

Functional builds bridge the gap between "I think" and "I know" by providing clickable evidence that proves your logic works.

- Drives strategic product decisions.
- Validates assumptions before coding.
- Aligns Engineering on behavior.

Instructor-Led Demo

Shattering the Speed Illusion

THE PROBLEM:

You have three working prototypes, but they all look like "vibe" sketches. Your VP of Design won't look at them because they don't match the brand, and your Engineering Lead says they are too generic to be useful.

Speed got you the idea. Now, strategic iteration must get you the buy-in

Instructor-Led Q&A

Reflection Moment

Feel free to **unmute and share**, or post your thoughts in the chat!

- To get you started thinking about what assumption this prototype *could* test if you focused it, share your perspective on:

Q&A DISCUSSION

2 minutes

Discuss the following question

1. Think about the bloated app you just saw. If you had to pick ONE user problem and ONE core screen, what would you build?

Quick Debrief

Accountability Statement

POST ON SLACK

IN ONE SENTENCE:

What is **one thing you learned about your product idea** that you didn't know 60 minutes ago?

Then, reply to 2 other learning sentences from your peers.

The Zero-to-One Velocity Shift

The distance between idea and prototype used to be measured in weeks. You just collapsed it to minutes. That's not just a skill—it's a superpower.

Strategic Shifts

The Mental Barrier:

You have proven that you can build functional software without writing a single line of code. The technical wall between "thinking" and "building" has been removed.

The Velocity Advantage:

While others are still debating static requirements, you are already demonstrating working logic. Speed wins, but speed combined with direction dominates.

Prototypes Built

From initial prompt to shareable URL in under 60 minutes.

Strategic Iterations

Compressing weeks of feedback into two rapid cycles.

Immersion

Total immersion in the build-test-iterate process.

The Vibe Coding Mindset

- **Product Managers must adapt the product lifecycle for probabilistic systems requiring continuous steering rather than rigid coding.** Utilizing AI-native tools allows PMs to move from paper requirements to functional prototypes that validate intent in real-time.
- **System prompting serves as the invisible code configuring a product's logic and behavioral guardrails.** Mastering the anatomy of role, task, and constraints allows PMs to move beyond basic chat to build reliable system logic.
- **Choosing between Prompting, Fine-Tuning, or RAG is a strategic decision based on whether the model needs instructions, style, or facts.** PM must use the optimization matrix to diagnose performance issues and pick the most cost-effective architectural tool for the job.

▶▶ Next Session

Lorem Ipsum

Overview

- Become an AI strategist capable of selecting and shaping AI bets that ship and move business metrics.
- Move from broad ideas to a formal AI Strategy One-Pager that defines the technical approach, data provenance, and target autonomy levels.

Extra Practice

Optional: Dig deeper into your hands-on lab experiences and try these exercises on your own.

1. Expand Your Functional Prototype in Lovable

Go back to your Lovable project and prompt the AI to generate a strategic dashboard view for Juno. Use the "Vibe" Prompt to style it like a professional analytics tool or your choice.

2. Audit a Manual Task for "AI-Ability"

Identify a frequent, rule-based task in your current job and draft a System Message to automate it. Use the Anatomy Prompt (Role, Task, Constraints, Format) to define the logic. Does the output require Few-Shot examples to match your company's "vibe," or is a Zero-Shot instruction enough to move the needle?

Your Opinion Matters To Us

We'd love to hear about
your experience!

At the end of each session,
please scan the QR code or use
the link to share your feedback.

Your insights help us improve
and make each cohort better
than the last.
