

Who Am I

MODULE 1

VIBE CODING

CERTIFICATION

Welcome to Module 1 of the Vibe Coding Certification. This is where your journey from ambiguity to production confidence begins.

Instructor: Add your name, photo, role, and background here. Example:

"Dejan Krstic | Product lead, AI course instructor | Teaching because I've built 100+ prototypes with AI—the methodology beats the tool."

This Course is about rapid prototyping, real feedback, and making decisions fast.

What We're Doing Today

The Confidence Line

The entire Vibe Coding course follows one arc—**the Confidence Line**. You start not knowing what to build. Through rapid building and feedback, you gain confidence. By the end, you'll ship a live product.

Today you're at the far left. We'll complete a full cycle—build, show, learn, decide—in just 2 hours. No theory first. **Let's go.**

Module 1: Dive In

Your First Full Cycle

VIBE CODING

CERTIFICATION

2 HOURS

Ground Rules

Not a Lecture

You'll build more in 2 hours than most PM courses cover in a week. This is hands-on from minute one.

Pre-work Done

Lovable is set up. We're skipping setup entirely. You're ready to build right now.

Move Fast

Tool issues? Message Slack. We're not stopping the class. Keep building, keep learning.

Let's go.

The Problem

Demo 1 Setup

Our enterprise customers are churning 30 days after onboarding. The VP of Customer Success thinks it's a UX issue. The Head of Product thinks we need better feature discovery. The CEO thinks we should add a self-serve analytics dashboard.

Nobody has data. Everybody has opinions.

This is the reality of product work. Competing theories, zero validation, and pressure to ship something. Sound familiar? This is exactly the kind of mess vibe coding helps you navigate—fast.

Lab 1: Your First Vibe Build

20 Minutes

Pick ONE scenario below, or use the problem you posted in Slack. If you're staring at a blank prompt box, use one of these three paths to get started.

Option A: Fitness Startup

A fitness startup wants to reduce member churn. "Something like Strava meets Discord." Build something that could help.

Option B: B2B SaaS

A B2B SaaS sales team spends 3 hours/day updating CRM notes after calls. The VP wants "some kind of AI thing to fix this." Build something.

Option C: Your Product

Use the problem from your Slack intro. Build a prototype for your real product challenge.

Anti-Blank-Page Scenarios

Hit blank-page syndrome? Use one of these two approaches to break through and start building.

Scenario 1: Copy and Customize

Use one of these templates. Replace [brackets] and hit go:

- "Build me a [community/social] feature for [fitness/sales/customer] users. Include a [matching screen / leaderboard / shared feed]."
- "Build me a dashboard that shows [account health / sales pipeline / user activity]. Include a [filter / list / chart]."
- "Build me a [type of app] that helps users [one action]. Include [one UI element]"

Scenario 2: First Screen Method

What's the first screen your user would see? What's on it?

Prompt: "Build me a [that screen] for [that user] with [those key elements]."

Example: "Build me a sales rep dashboard with recent calls, CRM sync button, and quick-note field."

Lab 1 Rules

- 1 20 minutes. Work alone.
No collaboration yet. This is about your instincts and speed.
- 2 No methodology. No framework.
Just open Lovable and go. Build on instinct.
- 3 Aim for clickable and showable.
Not perfect. Not polished. Just something you can share via link.
- 4 Stuck? Prompt again.
Still stuck? Prompt differently. Keep moving.

Produce: A prototype you can share via link. That's the only success metric right now.

Pair Review 1: Show and Swap

10 Minutes

01	0	0
Person A shares link	2Feedback (2 minutes)	3Switch roles
Person B clicks through as a user. Person A watches silently—no explaining allowed.	What I understood / What confused me / What assumption does this test?	Person B shares, Person A uses. Repeat the feedback cycle.

 **The rule:** You are NOT allowed to explain your prototype. Just share the link and watch them use it. This mirrors real user behavior—they won't have you there to explain.

What Surprised You?

Quick round. One sentence each: **Who learned something surprising from watching someone use their prototype?**

This is the power of rapid feedback. You just compressed weeks of assumption-testing into 30 minutes. You built something, put it in front of a real person, and learned whether your instincts were right.

Most product teams spend months debating features in conference rooms. You just shipped, tested, and learned in the time it takes to have one meeting.

Demo 2: From Basic to Pro

10 Minutes

Now that you've built something fast, let's talk about making it feel real. Demo 2 is fundamentally different from Demo 1.

Demo 1: What to Build

Three divergent directions. Exploration. Speed. Answering: "Which problem should we solve?"

Demo 2: How to Improve

Take ONE prototype and level it up. Iteration, not exploration.

Answering: "How do we make this look and feel like a real product?"

You're about to see how to transform a rough prototype into something you'd proudly show your VP.

The Upgrade Sequence

This is the systematic approach to leveling up any prototype. First, match a real design system using Mobbin screenshots for visual context. Second, add genuine interactivity—functional filters, detail views, and loading states that make it feel like a product, not just pictures. Third, use multi-prompt refinement to fix specific sections without rebuilding everything.

The key is steering, not starting over. Small, focused prompts compound into professional results.

Lab 2: Level Up Your Prototype

15 Minutes

Take your Lab 1 prototype. Choose at least TWO upgrades from the list below. Your goal is to transform what you built into something that feels production-ready.

Design Match

Find a Mobbin screenshot.

Match the design system—colors, layout, navigation patterns.

Add Interactivity

Make something work. Add a filter that actually filters. A detail view that opens. A form that validates.

Refine Without Rebuilding

Identify the weakest section of your prototype. Fix just that one part with a focused prompt.

Existing Product Track

Screenshot your actual product. Match its look and feel. Add your new feature on top of the existing design.

📄 **Produce:** Upgraded prototype link. Share in Slack: "Before: [X]. After: [Y]."

Pair Review 2: Did It Get Better?

10 Minutes

New pairs. 5 minutes per person. This review focuses on improvement and production-readiness.

Process

- Person A shares both links (original + upgraded)
- Person B reviews both as a user
- Switch roles and repeat

Feedback Questions

- What improved most noticeably?
- Does this feel like a real product now?
- Would you show this to your VP?

The "Would you show this to your VP?" question is the litmus test. If the answer changed from no to yes, you've crossed the threshold from toy to tool.

The Confidence Line: One Framework, Six Modules

A continuous progression from high ambiguity to production confidence, structured across six learning modules that

Each module builds on the last. Students move right as they gain confidence through building.

Tool vs. Toy

Tool

Did it help you decide something? Did you learn if your assumption was right or wrong? Did it move you from uncertainty to clarity?

Tools generate decisions. They answer questions. They reduce risk.

Toy

It looked cool but taught you nothing. It impressed people in a demo but didn't validate or invalidate any hypothesis. Toys generate applause, not insights.

The entire Vibe Coding course is about building tools, not toys. Speed without learning is just motion. The goal isn't to build fast—it's to **learn fast**.

EXERCISE

"Break It" Exercise

What we're breaking: The illusion that speed = value

"I gave Lovable the laziest prompt: 'Build me an app for tracking stuff.' Here's what I got."

The instructor shows a generic, bloated app — task tracker, calendar, notes, dashboard, settings. None of it connected. None of it answering a real question. All of it built in 60 seconds.

📌 **Lesson:** Vibe coding without a problem frame = toy, not tool. Speed is worthless if you're building the wrong thing fast.

Reflection Moment

What assumption could this prototype test if we focused it?

Take 60 seconds. Think about the bloated app we just saw. If you had to pick ONE user problem and ONE core screen, what would you build?

Quick answers from 2-3 volunteers. No wrong answers — just practice framing.

(That framing skill? That's Module 2.)

 ACCOUNTABILITY

Before We Wrap

60 seconds

Post Your Builds

Drop your best prototype link(s) in #builds
— original + upgraded versions

Caption It

What did you LEARN? Not what you built.
Focus on insights, not features.

Engage

Look at 2 other builds — react or
comment. This is your cohort. Support
each other.

Wrap + Preview

No Homework

You're done. Optional: Rebuild for your real product. Use a screenshot from your actual app. Drop it in Slack if you do.

Next: Module 2

You can build fast. Now: are you building the **right** thing? We'll add the lens that turns speed into strategy.

See you then.

What You Accomplished Today

Prototypes Built

From scratch to shareable in under an hour

Feedback Loops

Real users testing your assumptions

Hands-On

Zero lectures, all building

You didn't just learn about AI-assisted prototyping. You experienced the full cycle: prompt, build, test, iterate, improve. That's the foundation for everything ahead.

The Journey Starts Here

Most PM courses teach theory. This course builds muscle memory. You've already done more prototyping in 2 hours than most teams do in 2 months.

The confidence you felt when someone clicked through your prototype? That's what we're building toward — except by Module 6, it'll be a live product with real users.

Module 1 complete. From "I don't know where to start" to "here's a working prototype" in one session.

Next up: Making sure you're building the right thing, not just building fast.
