

Vibe Coding Certification

From ambiguity to deployed product in 6 modules.

Why the Current Course Falls Short

Tool-Dependent

Feels like a Lovable tutorial, not a methodology students can apply across platforms and contexts.

Too Shallow

Senior PMs need advanced frameworks and strategic thinking, not introductory "what is AI" slides.

Only One Person Builds

Group labs leave most students as passive observers rather than active builders.

Student NPS: ~3.8/5. The methodology has good bones. The packaging was wrong.

What Students Actually Said

“

"Felt more like a long Lovable tutorial"

”

“

"I wish we had individual projects instead of group projects"

”

“

"Building the actual live prototype was the highlight"

”

“

"The hands-on exercises really burned the concepts into our mind"

”

Students love building. They want more of it, with better framing.

The Confidence Line: One Framework, Six Modules

A continuous progression from high ambiguity to production confidence, structured across six learning modules that

t build on each other.

Pre-Work + 6 Modules

This Isn't a Light Rework

Every module has been fundamentally redesigned

Before	After	Type
(no pre-work)	Pre-Work: Async tool setup + first build. Students arrive Day 1 ready.	NEW
M1: Accelerate Idea-to-Validation. Intro AI slides, basic demo.	M1: Dive In. Build first prototype in 15 min. Full Build-Show-Learn-Decide cycle.	REBUILT
M2: Write Advanced Prompts. Basic prompting, token windows.	M2: What to Test. Problem framing, assumption mapping, validation design.	REBUILT
M3: Define Modern Specs. Static PRDs, confusing terminology.	M3: Precision Prompting. Context layering, agentic prompting, living prompt packs.	REBUILT
M4: Build & Debug. Instructor-led, students watch.	M4: Graduation Moment. When to stop exploring. Extract living specs. Refactor.	REWORK
M5: API Integrations. Step-by-step Lovable walkthrough.	M5: Make It Real. APIs, edge cases, PM-to-engineering handoff. Tool-agnostic.	REWORK
M6: Deploy & Scale. One person builds for the group.	M6: Ship It. Everyone builds. Deploy, present, compete. Validation Evidence Brief.	REWORK

3 modules rebuilt from scratch. 3 restructured. 1 entirely new. Plus a new instructor guide, success metrics, and assessment rubrics.

What Students Leave With

Deployed Product

Live URL, shareable with stakeholders and ready for real user feedback.

Validation Evidence Brief

The real PM deliverable that demonstrates validated learning and strategic decisions.

Living PRD

Specs extracted from building, not planned before — a working document that evolved with the product.

Personal Prompt Library

Reusable toolkit for daily work, customized to individual workflow and challenges.

How We Measure Impact

4.5+

Overall NPS

Up from ~3.8 in the current
version

90%

Working Prototypes

Students produce working
prototype each module

100%

Live Deployment

Groups deploy to live URL by
course end

60%

Workplace Application

Using vibe coding at work within
30 days

What Nobody Else Teaches

The Full

Ambiguity-to-Production Arc

Reforge stops at prototype. Maven stops at tools. We cover the entire journey from zero clarity to shipped product.

The Graduation Moment

73% of vibe-coded apps fail to reach production. We teach the critical pivot point: when to stop exploring and start building for real.

Validation as the Outcome

The deliverable isn't just a deployed app. It's a validation brief that demonstrates product judgment. This is a PM course, not a coding course.

Where we will sit in the Market

Next Steps

Why This Wins

This is not a course about AI tools. It's about how modern product managers validate intent faster than ever before using vibe coding as the engine.

Students start in ambiguity, gain confidence through rapid building, and ship production-ready products backed by validated evidence.
